EVERGUARD Surfacing recommends the following procedures to care for, and extend the life of, your new FAST TRACK running surfaces.

1. NO vehicles of any kind, including bicycles, wagons, should be allowed on the track surface; turning, starting and stopping too abruptly can possibly tear the surface. Maintenance equipment can cross the track, but protective matting should be used.
2. Runners should NOT wear spikes longer than 3mm. (pyramid or pin). Longer spikes will accelerate the wear of the surface and possibly tear it.
3. Protective matting should be used where football players, soccer players, or other athletes cross the track.
4. The track surface shall be kept clean of dirt and silt, as this will act as an abrasive underfoot and accelerate the wear of the surface.
5. Control vegetation a minimum of 6" from all edges of the surface.
6. Maintain proper drainage – keep swales and catch basins clear and in good working order.
7. Any petroleum or solvent spills on the track surface should be washed immediately with soap and water.

Compliance with the above recommendations will insure maximum longevity and help to keep the original appearance of your track surface and event markings.
